US Army Code Book 1918

US Army Vigenère Disk 1912

- Radio radically transformed battlefield strategy, but the enemy can now intercept all messages
- Cipher technology was not up to the task
- Ciphers were manual, error-prone, 450 years old... and all were broken!

Birth of crypto warfare

- Explosion of new cipher technology during WW1:
 - One-time teletype tape
 - Cipher wheel
 - Strip cipher
 - Burst encoder
 - 4 electro-mechanical rotor machines:

Scherbius family

Hugo Koch
Holland
(1870-1928)

Photo credit:
Koch family

- **Scherbius/Koch collaborated on Enigma, filed separate patents**
- **German Navy began testing Scherbius Enigma in 1926**
- **In 1927, Scherbius “curiously” bought the rights to Koch’s patent, paid 600 Dutch guilders (~\$350)**
- **“Curious” because Scherbius owned the identical German patent**
- **Koch died in 1928; Scherbius in 1929 in a horse carriage accident**
- **Neither knew the role their invention would have in history**

History rewritten in 2003

OCTROORAAD

OCTROOI N^o 10700.

KLASSE 15, GROEP 20.

NAAMLOOZE VENNOOTSCHAP INGENIEURSBUREAU „SECURITAS“, te Amsterdam.

NEDERLAND.

Gehelmschriftmachine.

Aanvraag No. 13068 Ned. ingediend 7 October 1919, 2 n. 52 m. n.n.; openbaar gemaakt 15 Juni 1920; ingekonink 14 December 1920.

Met een gehelmschriftmachine moet men een mededeeling in gewoon schrift in een kort mogelijk tijt kunnen omzetten in een te overbrengen teekenschrift, dat is, dat het voor overbrengen niet mogelijk is, daardoor verder de oorspronkelijke mededeeling af te lezen. Het op deze wijze verkregen teekenschrift moet weer aan overeenkomstig met de teekenschrift van een overbrenging, machine in gewoon schrift terug worden omgezet.

De scheid van onafleesbaarheid van het teekenschrift maakt het noodig, de machine op een groot aantal wijzen te ontwerpen, zodat zelfs iemand, die met de machine bekend is, noch door bekekening, noch door proefnemingen of op andere wijze het gehelmschrift kan oplossen.

Het Oostenrijksch octrooi N^o 62056 beschrijft reeds een teekenschrift, bestaande uit twee elektrisch gekoppelde schakelmechanismen, een commutator, die in de geschiktheid, om teekenschrift te ontzetten van de teekens. De commutator bestaat uit een vaste schijf, met volgens een eenduidig getal van contacten, aangekonden op de stroom naar de twee machines, en uit een draaibare schijf met eveneens volgens een eenduidig getal contacten, die aan de draad naar de andere machine zijn verbonden en ten opzichte van de eerste twee contacten kunnen worden ingesluisd. Gemiddeld octrooi N^o 62056 beschrijft reeds een teekenschrift, dat men eenige van zulke paren schijven achter elkaar kan schakelen om hierdoor het teekenschrift te ontzetten te kunnen.

Met behulp van een machine met slechts twee commutator volgend, het genoemde Oostenrijksch octrooi N^o 62056 kan men een gehelmschrift omzetten, behoudt de teekenschrift worden ingesluisd, en hierbij is het teekenschrift niet meer te ontfangen, maar het is mogelijk, dat men de teekenschrift van het overbrengen van energie tussen den toekenneder en den toekennoverer een of meer tusschenstakken zijn geschiktheid, waartoe de plaatsen van toelreding van energie aan de andere zijde op onafleesbare wijze twee aan twee door geleidingen zijn verbonden, waarbij de tusschenstakken zodanig verschuifbaar zijn aangebracht, dat de plaatsen van toelreding en die van uitlreding van energie zich in de richting van hare verbindingen zijn verplaatst.

De uitlreding bestaat in beginsel in de toelreding van de in fig. 1 weergegeven vreesing of omgeschakeld met behulp waarvan het mogelijk is, door een enkele beweging de schakeling van een groot aantal geleidingen op de meest onafleesbare wijze te veranderen.

Figure 1 geeft een enkel voor, dat uit drie deelen 63, 64 en 65 bestaat. In de deelen 63 en 64 is een groot aantal geleidingen (hier in den vorm van lijnen) vereenigd in het tusschenstak 63 en 64 van de deelen 63 en 64, welke geleidingen door de lijn 4 in het deel 65, punt 1, v. over de tusschenstak 64 naar de lijn 71 van het deel 65. Op overeenkomstige wijze over het tusschenstak 64 naar de lijn 71 van het deel 65. Op overeenkomstige wijze over de lijnen 70, 74, 75, 76, 77, 78 en 79 van het deel 65.

Zijn nu in alle lijnen van het deel 65 cilindren met zijgers aangebracht, die

Verplichtbaar bij het Bureau voor den industrielen Eigendom te 's Gravenhage.

Preis per ex. f. 0.50.

- Dutch patent never built
- German patent was early version of Enigma
- Scherbius bought Dutch patent on 1/28/1927

**German patent DE425147
filed 9/26/1920**

DEUTSCHES REICH

AUSGEGEBEN AM 13. FEBRUAR 1920

REICHSPATENTAMT

PATENTENSCHRIFT

— Nr. 425147

KLASSE 42 n. GRUPPE 14

(S. 204/4, 131/14)

Chiffriermaschinen-Aktiengesellschaft in Berlin.

Chiffriermaschine.

Patentiert im Deutschen Reich vom 26. September 1920 ab.

Eine Chiffriermaschine soll eine gegebene Klarschrift in kürzester Zeit so in eine Anzeichenreihe von Buchstaben oder Zeichen umwandeln, daß es nicht möglich ist, daraus die ursprüngliche Klarschrift zu ermitteln. Die so chiffrierte Schrift soll wiederum schnell und einfach durch dieselbe oder eine ähnliche Maschine in die ursprüngliche Klarschrift zurückverwandelt werden können.

Die Forderung der Unlösbarkeit der Gehelmschrift bedingt eine hohe Zahl von willkürlichen Einzelmöglichkeiten der Maschine und eine Veränderung des Schlüsselwörter während des Schreibens, damit auch der Kenner der Maschine nicht in der Lage ist, aus der Gehelmschrift die Klarschrift zu erschließen, sondern nur die Klarschrift zu erschreiben, wenn diese Bedingungen mit möglichst möglichst einfachen Mitteln erfüllt werden.

Die bisher bekannt gewordenen Chiffriermaschinen erfüllen diese Forderungen nur teilweise. Die vorliegende, in den Abb. 1 bis 10 dargestellte Erfindung wird allen obengenannten Bedingungen gerecht. Die Grundzüge der Erfindung bildet das in Abb. 1 dargestellte Vielfachventil, welches an gewohnter, mit einer einzigen Bewegung des Ausschub von einer größeren Anzahl von Rollenmaschinen vollkommener und in der unangenehmsten Weise zu verschieben. Die Abbildung stellt ein Rollensystem dar, das aus drei Teilen A, B und C besteht. In den beiden äußeren Teilen A und C sind die Rollen parallel, in B verlaufen dieselben in beliebiger Weise die Mündungen der Rollen von A und C. Kommt man zu B von

Ort 4 auf A, so führt der Weg über das Zwischenstück B zum Ort 11 auf C. In analoger Weise werden aus den Orten 2, 3, 4, 5, 6, 7, 8, 9 auf A die Orte 1, 10, 11, 12, 13, 14, 15, 16, 17, 18 auf C. Sind nun vor allen Rollen des Schlüsselwörter A Ventile oder kleine Zylinder angebracht, welche in einem Buchstaben des Alphabets tragen (in der Art, wie in Abb. 6 links angegeben), und hinter jedem Rolle des Schlüsselwörter ein kleiner Zylinder mit Kolben, welcher in einem Buchstaben des Alphabets besteht ist und diesen Buchstaben durch Herunterdrücken des Kolbens treibt (in der Art, wie in Abb. 6 rechts angegeben), so läßt sich mit einer derartigen Anordnung chiffrieren. An Stelle eines jeden an den linken Rollen niedergedrückten Buchstaben erscheint ein bestimmter anderer Buchstabe unter den Rollen des rechten Kolbens (Abb. 6). Diese Chiffrierung ist jedoch sehr leicht lösbar. Daher soll nach den obengenannten Forderungen der Schlüssel auf einfache Weise oft verändert werden können. Um dieses zu erreichen, ist das Zwischenstück B verschickbar angeordnet. In Abb. 2 ist dieselbe in eine Teilung verschoben dargestellt. Jetzt werden aus den Orten 2, 3, 4, 5, 6, 7, 8, 9 auf A die Orte 1, 11, 12, 13, 14, 15, 16, 17, 18 auf C. In ähnlicher Weise verändert sich der Chiffrierzustand bei jeder weiteren Verschiebung des Zwischenstückes B.

Zum Dechiffrieren brauchen die Rollen in Abb. 1 nur in der Weise an die Ventile und Kolben angeschlossen zu werden, daß beide miteinander verschiebt werden. Aus der Zahl 4

Birth of crypto warfare

- Explosion of new cipher technology during WW1:
 - One-time teletype tape
 - Cipher wheel
 - Strip cipher
 - Burst encoder

Enigma machine

Enigma means puzzle or mystery in German & most European languages

klappe
schließen
=
close **y**ther flap

Enigma machine - under the covers

- Typewriter style cipher machine, with light bulbs instead of printer
- Electro-mechanical rotors was the key innovation
- Rotors turn odometer style, so every letter in a message uses a different algorithm
- Reflector gives reciprocal encryption / decryption
- German military added plugboard

Enigma wiring - animated!

example: "A" enciphers/deciphers to "H"

Cryptographic strength of Enigma

- Theoretical maximum # of Enigma settings is 3×10^{114} (# atoms in universe = 10^{80})
- If an enemy captures the Enigma, the # settings is still astronomical - 10^{22}
- 10^{22} is equal to a 75 bit key, far better than the 56 bit DES standard, used until 2001
- A 75 bit key means:

Webb Space Telescope view of cartwheel and spiral galaxies

Photo credit: NASA, ESA, CSA, STScI

If 100,000 Enigma operators could each check one key setting every second, 24X7...

It would take the age of the universe to break the code!

Enigma Weaknesses

Photo credit: Deutsches Bundesarchiv, colored by Lopatin V.

1. Greatest vulnerability was lax operator procedures
2. Reflector was reciprocal, so no letter encoded to itself
3. Rotors had regular, odometer movement
4. Ironically, brute strength of the Enigma gave Germans too much confidence in its security

Panzer General Heinz Guderian on communications truck with Enigma (1940)

Poland was first to break Enigma

**Marian Rejewski (1905-1980),
in UK c.1943/44**

Photo credit: Public domain, unknown photographer

- In 1932, German spy Hans-Thilo Schmidt sold Enigma keys to Allies
- Marian Rejewski used mathematics to recreate & break Enigma, in Dec. 1932
- Breakthrough was breaking of rotors and plugboard separately, so now...
 - 100,000 operators can break Enigma in 2 hours vs “twice age of universe”!
- Poles made “Bomba,” 6 Enigmas in series, to quickly break daily key (Bomba = Eureka in Polish)

- Polish codebreaking success kept secret for 7 years
- Poles finally disclosed Enigma secrets to UK and France just 5 weeks before Germany invaded Poland on Sept. 1, 1939

British effort in breaking the Enigma

Bletchley Park Mansion

Photo credit: Standardissuemagazine.com

- In 1939, UK began a major decoding effort at Bletchley Park, employing 11,000
- Effort led by Alan Turing, who built the Bombe: 36 Enigmas in series to find possible rotor settings
- After the Bombe found rotor settings, plugboard cables were solved manually

Bombe - the beginning of computing

Alan Turing
(1912-1954)
“Father of
Computing”

US Bombe

Photo credit: NCM, Ft. Meade, “Solving the Enigma”

Photo credit: Godfrey Argent Studio, via The Royal Society

- Poles named their electro-mechanical codebreaker “Bomba,” British used “Bombe” in honor of Polish contribution
- British exploited cribs vs Poles exploit of double message key
- 211 UK Bombes were built, most were destroyed after WW2
- US employed NCR to build a faster version of the Bombe to decode the 4-rotor naval Enigma - 121 were built

Colossus computer

Photo credit:

Photo credit: Ralph Simpson,
device at NCM, Ft. Meade, MD

Enigma
story

- Colossus world's first programmable, digital computer
- Uses 2400 vacuum and relays
- Colossus breaks Lorenz teletype cipher, not Enigma
- Lorenz cipher used for high level messages

U-boat peril

- Before the US entered the war, U-boats sank 60 ships / month
- U-boats roamed freely, then formed “wolfpacks” to sink convoys efficiently
- Nazis expected a UK blockade to result in a quick surrender
- Naval Enigma was initially the same as the Army, but later a 4-rotor version was used with more rigorous procedures
- Naval Enigma messages were secure until May 1941

“The only thing that ever really frightened me during the war was the U-boat peril.”

- Winston Churchill

U-boat sinks an English freighter, from a German book published during WWII

Capture of U-110

**U-110 Captain
Fritz-Julius Lemp**

Photo credit: reibert.info

- First code books captured from a U-boat was on May 9, 1941
- Captain died trying to scuttle U-110
- Germans didn't know 3 months of codes were stolen, by Lt. Balme
- 5 ships, from 1 Enigma message, were sunk on June 3 & 4, 1941
- U-110 capture was the turning point in the Battle of the Atlantic

**Lt. David Balme on
deck of HMS Bulldog**

Photo credit: forces.net

Balme leads boarding party to captured U-110

Photo credit: uboatarchive.net

UK sailors on deck of U-110

Photo credit: uboatarchive.net

Battle of the Atlantic

- After breaking Naval Enigma, the British continuously re-routed convoys to avoid U-boats
- Unarmed weather trawlers carried Enigma, a recurring target for more code books
- British targeted supply ships and mother U-boats
- Early U-boat success turned to failure, 725 of 1155 U-boats and 82% of 35,000 sailors never returned from sea
- Some estimate breaking the Enigma shortened WW2 by 2 years

US bombing of U-117 – Aug. 1943

Photo credit: US National Archives

Allied shipping losses vs codebreaking

Allied Shipping Losses in WW2

Did Germans know Enigma was broken?

- Allies only exploited Enigma messages after deception of traditional sources: (spotter planes, spies, etc.)
- But, Allied codebreaking should have been suspected:
 - 5 ships, from one Enigma message, all sunk in 2 days!
 - Supply convoy for Gen. Rommel in Africa found and sunk, despite continuous cloud cover from Naples to Africa
- Was 4-rotor Enigma designed to counter UK codebreaking?
 - No, more likely security from other Nazi military or spies
 - Confirmed in interview with Admiral Dönitz in 1974

Admiral Dönitz inspects U-boat at Saint-Nazaire, France

Photo credit: Bundesarchiv

Enigma after WW2

- Codebreaking success was kept secret for 41 years, until 1974, despite thousands who knew the secret in the US and UK
- US and UK encouraged use of Enigma by other countries, including Allies, reading their secret messages for 3 decades
- About 35,000 Enigmas were manufactured
- Today, about 380 Enigma machines are known to exist, half in museums, half in private collections

Photo credit: US Navy release

David Hatch, NSA Historian, tells story of US Navy missile test, sinking “pallets” of Enigma machines

(pallet = 150 Enigmas = 2 tons)

Enigma prices

Enigma prices doubled after release of movie, "The Imitation Game" on Christmas, 2014

Benedict Cumberbatch operates Enigma from movie, "The Imitation Game"

Photo credit: StudioCanal

- In June 2017, a professor of cryptology found a "typewriter" in a Romanian flea market
- He knew it was an Enigma and bought it for 100 Euros
- Immediately sold on Romanian auction site for 45,000 Euros
- Sold 4 months later in US by Rau Antiques for \$245,000
- Rarity plus interest generate record prices at auction:
 - \$441K for a 3-rotor Enigma at Sothebys on 4/30/21
 - \$860K for a 4-rotor Enigma at Sothebys on 12/17/19

Cipher History Museum

Addendum

The following pages show the mathematics of the Enigma key space, both theoretically and as implemented by the Nazis

Plugboard settings

- The German military addition of the plugboard added more key space than the rotors

- The # of possible plugboard settings is a function of 3 variables:
 1. # plugboard cables, p , can be from 0 to 13
 2. # of groupings of possible plugged letters (2p letters out of 26) = $26! / ((2p!) \times (26-2p)!)$
 3. # interconnections of letters within each group of plugged letters chosen from #2 = $(2p-1) \times (2p-3) \times (2p-5) \times \dots \times 1$
- The 3 items above are calculated on the next slide

Plugboard settings

1. # plugboard cables	2. # groupings of plugged letters $26! / ((2p!) \times (26-2p)!)$	3. # interconnections for each set of plugged letters $(2p-1) \times (2p-3) \times (2p-5) \times \dots \times 1$	Total # possible settings $(\text{column 2}) \times (\text{column 3})$
0	1	1	1
1	325	1	325
2	14,950	3	44,850
3	230,230	15	3,453,450
4	1,562,275	105	164,038,875
5	5,311,735	945	5,019,589,575
6	9,657,700	10,395	100,391,791,500
7	9,657,700	135,135	1,305,093,289,500
8	5,311,735	2,027,025	10,767,019,638,375
9	1,562,275	34,459,425	53,835,098,191,875
10	230,230	654,729,075	150,738,274,937,250
11	14,950	13,749,310,575	205,552,193,096,250
12	325	316,234,143,225	102,776,096,548,125
13	1	7,905,853,580,625	7,905,853,580,625
Total			532,985,208,200,576

Rotor settings

- The internal wiring of each rotor could be arranged in 26! different combinations. Since only 3 rotors are used, the number of combinations when selecting 3 unique rotors out of 26! is:
 - $26! \times (26! - 1) \times (26! - 2) =$
 $65,592,937,459,144,468,$
 $297,405,473,480,371,753,615,$
 $896,841,298,988,710,328,553,$
 $805,190,043,271,168,000,000$
- Each of the 3 rotors could be set to any letter:
 - $26 \times 26 \times 26 = 17,576$
- The rotors advance like an odometer, the setting to enable this is a notch set to any letter of the alphabet:
 - $26 \times 26 = 676$ (Note: notch on left-most rotor has no effect)

Reflector settings

- The reflector scrambles the letters in pairs so it could encrypt or decrypt with the same setting
- The letter “A” could be switched to any of the 25 remaining letters, the next letter could be switched to any of the 23 remaining letters, and so on
- Notice this result is the same as using 13 plugboard cables, since all letters are paired (see chart on page 23)
 - $25 \times 23 \times 21 \times \dots \times 1 = 7,905,853,580,625$

Total theoretical number of settings

- The total theoretical number of Enigma settings is thus the product of the 5 items on the previous 3 slides, or...
 - 3,283,883,513,796,974,198,700,882,069,882,752,878,379,955,261,095,623,685,444,055,315,226,006,433,615,627,409,666,933,182,371,154,802,769,920,000,000,000
 - Or 3.28×10^{114}
- This number is far greater than the total number of atoms in the observable universe (10^{80})

Webb Space Telescope view of cartwheel and spiral galaxies

Photo credit: NASA,
ESA, CSA, STScI

Theory vs. practice

- The theoretical number of Enigma settings was not achieved in practice by the Germans, the number of settings the Allied Forces encountered for the standard 3-rotor Enigma:
 - 10 plugboard cables were always used, reducing errors and the possible combinations to 150,738,274,937,250
 - Only 5 fixed rotors were issued out of 26! possibilities. Since the wiring was known, selecting 3 out of 5 is $5 \times 4 \times 3 = 60$
 - The initial settings of the rotors and the positions of the notches remain the same at 17,576 and 676
 - Reflector setting was known and remained unchanged = 1
 - The product of the above numbers is:
 $107,458,687,327,250,619,360,000$ or 1.07×10^{23}
 - 1.07×10^{23} is equivalent to a 76 bit key, better than 56 bit DES, the first PC standard in use until 2001

Enigma codebreaking example

- Germans considered the Enigma to be unbreakable
- Before computers, a brute force attack was impossible:
 - To test 10^{23} key settings:

If 100,000 Enigma operators could each check one key setting every second, 24X7...

It would take twice the age of the universe to break the code!

- Each U-boat, Air Force, and Army unit had separate keys, which changed daily!
- The British Bombe did not perform brute force attacks but searched for possible cribs to decode the rotors only
- The plugboard, which gave more key space than the rotors, was manually, and easily, decoded
